Experie

# About Cropwise Operations

Cropwise Operations is a multi-component digital solution for remote control of agricultural land, which includes real-time monitoring of fields, crop advisory and scheduling, scouting, automated documentation, planning and execution of agricultural operations, compliance management, and comprehensive integration with third-party services and products.

The main goal of Cropwise Operations is to increase the farming efficiency and significantly reduce the cost of ag operations due to early identification of problem areas in fields and rational use of resources.

The company was founded in 2013. It was acquired by Syngenta Group in 2019. Now Cropwise Operations is a leading player in the Eastern Europe digital agriculture market, which is already used by farmers in over 40 millions of hectares.

# Vegetation Index (NDVI)

NDVI — Normalized Difference Vegetation Index — the indicator used to evaluate and analyze the development of the plant biomass during vegetation. Green leaves of plants absorb waves in the visible red range and reflect waves in the near infrared. The larger the leaf surface of plants is and the more chlorophyll is there in the leaves, the stronger the plants absorb the red light that falls on them (and less reflect it).

The index is calculated as the difference between the reflectance values in the near infrared (NIR) and red (RED) spectral areas, divided by their sum  $NDVI = (NIR - RED) / (NIR + RED)$ . The system uses a standard Vegetation Scale where the Vegetation Index takes a value from 0 to 1.

# Image Lab

The tool helps to compare different types of images (Visible, NDVI, NDVI contrast, and NDVI Variability) to consider all the factors that affect crop yields. The Image Lab tab is located on a field page and offers the user several solutions for a comprehensive analysis of the field condition and crops development.

The tool makes it possible to overlap different types of images to understand better, for example, how the terrain features affect crop vegetation. Based on the Productivity Images the user can create VRA tasks, manage problematic and productive areas of the field, control technological operations' risks.

# Vegetation Change Analysis

Cropwise Operations enables its users to track the Vegetation Index (NDVI) changes within three weeks from a selected day in all fields of a required field group.

Percentage changes are calculated based on the analysis of Sentinel-2 and Landsat 8 satellite images.

The screenshot shows a web application interface for 'Vegetation change analysis'. The top navigation bar includes 'Monitoring center', 'Agro', 'Telematics', 'Map', 'Fields', 'More', and 'Platform'. The main title is 'Vegetation change analysis' with a date filter set to '07/03/2022'. A 'Columns' dropdown menu is visible. The table below displays data for several fields, including crop types (Corn, Sunflower), sowing dates, NDVI values, and NDVI changes over 3-week, 2-week, and 1-week periods. The table also includes 'NDVI Variability' indicators.

Field	Crop		Sowing date 2022	NDVI	NDVI change			NDVI Variability
	2021	2022			3w	2w	1w	
	06/12/2022	06/19/2022			06/26/2022	06/19/2022	06/26/2022

MON-KOP-010	Corn	Sunflower	05/28/2022	0,326 06/30/2022	+4 % 0,304 0,315	+3 % 0,315 0,324	+17 % 0,324 0,380	Average 06/29/2022

# Vegetation Variability Change Analysis

NDVI Variability images help to notice deviations in plant development in time. The highest value (or red color) of the variability means significant Vegetation Index difference within the boundaries of one field, i.e. 0.08 and more. Cropwise Operations recommends paying closer attention to such fields.

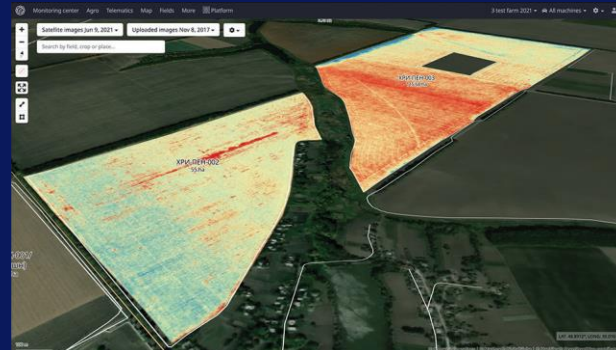

The report shows changes in field development over several months, which helps the user to determine the real causes of problems in the field.

# UAV Images

Users can upload field shots made by unmanned aerial vehicles (UAVs) — drones, copters, etc. into Cropwise Operations.

This tool helps to obtain accurate information about the crop condition in all field areas due to images with very high resolution (up to several centimeters per pixel). The tool can be used to analyze the crop condition, when the weather does not allow the satellite to take a high-quality image.

# 3

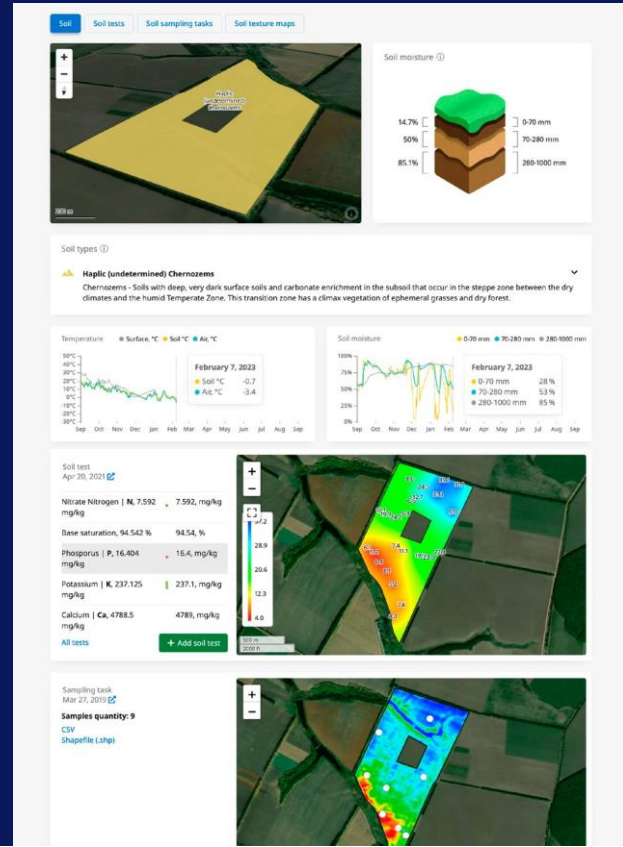

## Crop Health. Soil and Weather

# The Soil Tab

Analyze the dynamics of key indicators of soil quality, compare them and assess the effect of soil condition on crop yields in the Soil Tab on the field page.

The most recent data on soil surface temperature, soil moisture on three different depths and charts for changes in these indicators within a year are available on one page. The field soil types are automatically determined according to the FAO global classification and their detailed description is provided. On this page the user can also find the latest Soil Tests, Sampling Tasks and Soil Texture Map.

In the Soil Tab, determine points for soil sampling, upload soil test results and generate analysis maps based on them. Create soil texture maps using electrical conductivity tests and soil brightness images.

Soil Texture Maps

# Soil Analysis

One can add Soil Tests to Cropwise Operations both manually, and upload from a file. Soil Analysis Maps are generated based on the Soil Test results. Soil Tests can be used as the data source for Variable Rate Application (VRA) tasks. One can also compare Soil Analysis Maps and Vegetation Maps for current and previous seasons to see how structure and type of the soils affect the yields.

**Import of Soil Test results from a spreadsheet in the following formats: .csv, .ods, .xls, .xlsx, .dbf**

**The Analysis Method is a new required indication for potential third-party services integration and crop nutrition recommendations.**

**The ability to specify nutrients content level in soil.**

**The Soil Analysis Maps for field groups and the option to download them as PDF files.**

**Soil Test results downloading in Excel file.**

# Weather Data

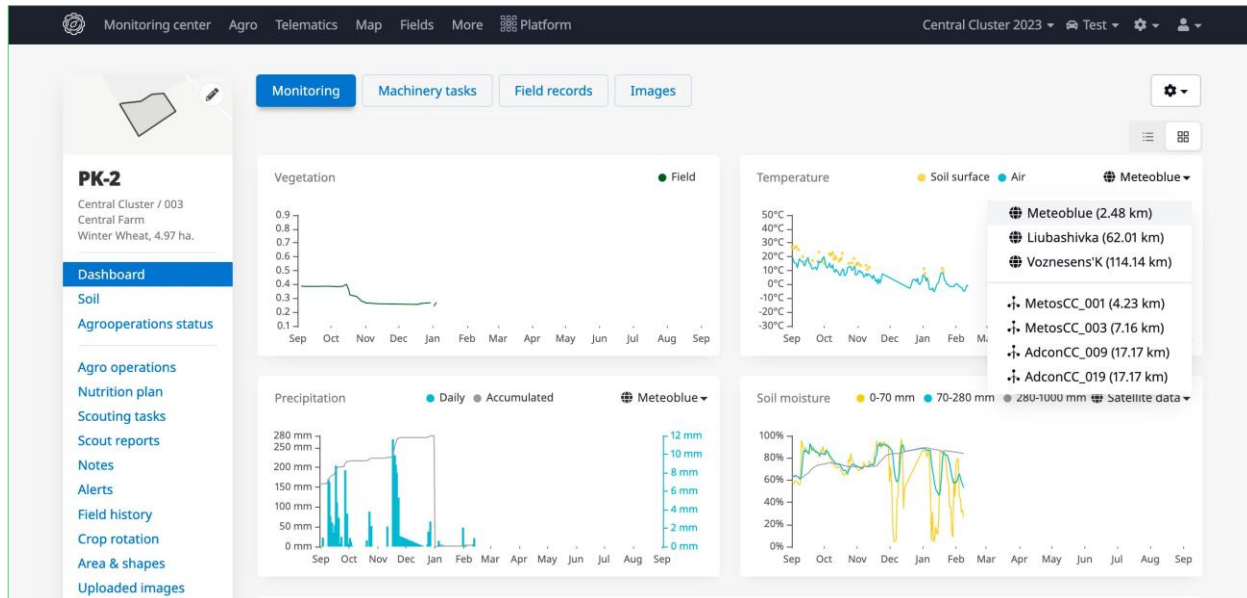

Cropwise Operations receives weather data from global public weather stations of the World Meteorological Organization system, global private weather services (Dark Sky, Meteoblue), satellite systems, and private weather stations if any.

Weather data is calculated individually for each field. The system automatically identifies the most reliable data source for each field depending on its location. Air temperature and precipitation data is updated daily. Besides, historical information about weather conditions is available.

Add your private weather stations to the system. Cropwise Operations integrates data from Adcon, Arable, Davis, iMetos, Weather Underground and other services. The system will automatically determine two global and four private stations closest to each field. You are free to choose from which to display weather data for your field.

The system also generates an individual weather forecast for every field that allows farmers to plan field works more efficiently. One can also receive weather forecast from private stations if they have software with such functionality. All users can receive an extended daily weather report in emails.

# Soil moisture

The dynamics of Soil Moisture change determines its water regime and has a strong influence both on the course of biological processes in the soil, and on providing plants with water, and consequently — on the quality of the yield.

The system displays Soil Moisture in percentage of total water holding capacity. Total moisture capacity characterizes the ability of the soil to retain moisture, in case all the pores are completely filled with water. The indicator helps to track the tendency to increase or decrease the amount of moisture in the soil.

Cropwise Operations uses data combinations obtained from four satellites — synthetic-aperture radar and weather satellites to calculate Soil Moisture at three depths:

- from 0 to 7 cm (0 to 70 mm)
- from 7 to 28 cm (70-280 mm)
- from 28 to 100 cm (280-1000 mm)

Satellites are using soil microwave scanning technology on a daily basis. The initial resolution is 10x10 km per pixel with a possible increase (based on the weather data analysis) up to 1x1 km per pixel. Microwave scanning is performed with the same accuracy for all depths.

Today this model is considered to be the most reliable in the world.

## Soil moisture level at three depths

Soil moisture is indicated in 1 m<sup>3</sup> per 1 m<sup>3</sup> of soil at different depths. The **top 0-7cm** is the most critical as this is where seeds germinate and most of the roots are located. The **sub 7-28cm** is important for nutrients and reservoir for soil moisture.

Moisture	Description	Crop and vehicle traffic
90 % +	Flooded / Excessive	Crops will wilt from excess moisture.
80 – 90 %	Oversaturated / waterlogged	Crops will struggle to grow.
70 – 80 %	Saturated / Abundant	Crops will grow well.
60 – 70 %	Very wet	Crops will grow very well.
50 – 60 %	Wet / Adequate	Crops will grow optimally.
40 – 50 %	Slightly wet / Good	Crops will grow very well.
30 – 40 %	Somewhat dry / Limited	Crops will grow, but not well.
20 – 30 %	Dry	Crops will struggle to grow.
10 – 20 %	Very dry / Insufficient	Crops will start to wilt.
< 10 %	Critically dry	Crops will wilt.

# Plant Disease Control

Cropwise Operations integrates all modifications of iMetos weather stations by Pessl Instruments and supports company's Plant Disease Models tool. The service requires the availability of your own iMetos weather station added to the Cropwise Operations account and a license to use the tool.

In a real-time mode one can get the forecast for over 85 disease models for 40 crops. The working range is up to 50 km from a weather station for all fields with a specific crop. It is also possible to set specific criteria — a disease, probability percentage of the disease — to receive automatic notifications as soon as the forecast meets certain conditions.

The screenshot shows the Cropwise Operations interface for monitoring plant diseases. The main content area is titled 'Monitoring' and displays 'Threats data' and 'Recommendations' for the field 'WC-PEN-005' (West Cluster / 3 test farm Winter Wheat, 118.36 ha).

**Threats data:**

Disease	Probability	Risk Level	Recommendations
Blight of cereals (Gibberella zeae)	44.2%	Risk	RECOMMENDATIONS: Ploughing-disking in spring significantly reduces maize stalk rot; however, the effects on...
Speckled leaf blotch (Septoria tritici)	33%	Weak Infection	RECOMMENDATIONS: Resistant varieties are the best control for Septoria tritici blotch. Foliar fungicides are also an option for cont...

**Plant Disease Models:** Pessl Instruments Plant Disease forecast. METOS by Pessl.

Data obtained at 14:49 (3 days ago). Responsible people... (show list)

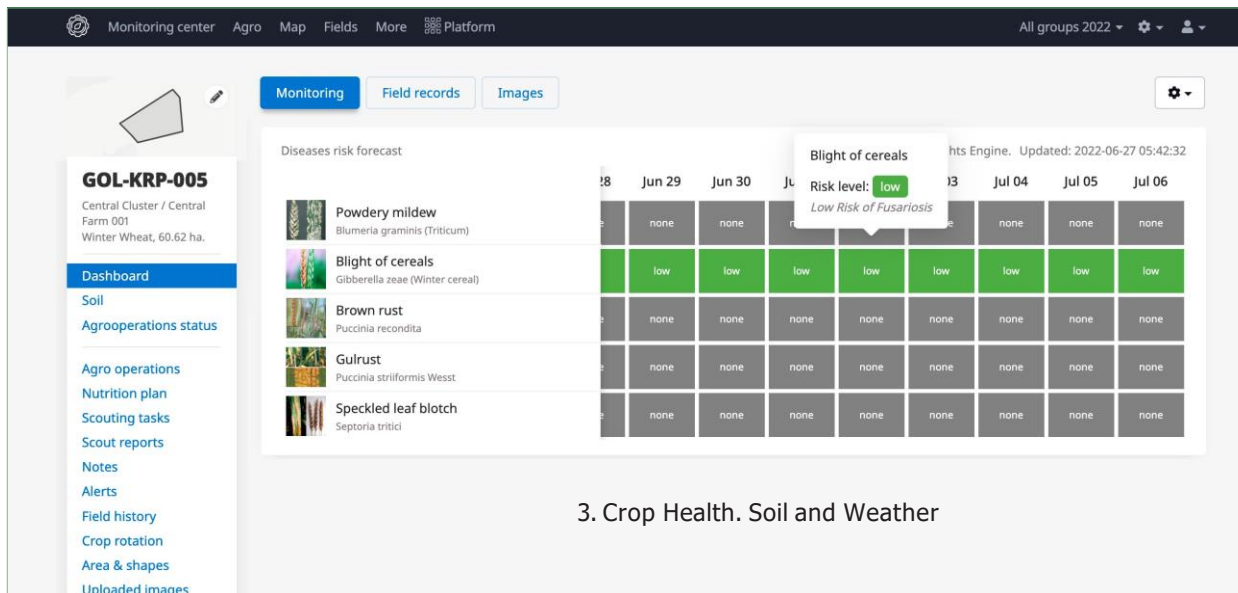

The interface also includes a sidebar with navigation options: Dashboard, Soil, Agrooperations status, Agro operations, Nutrition plan, Scouting tasks, Scout reports, Notes, Alerts, Field history, Crop rotation, Area & shapes, Uploaded images, and Analytics. A weather forecast is visible at the bottom of the page.

# Cereal Disease Risk Forecast

The Cereal Diseases Risk Forecast service based on the Avizio model works for fields with spring and winter wheat and barley. The system warns about the risks of Brown Rust, Powdery Mildew, Septoria, Fusarium, and more. The first forecasts are formed starting approximately from stage 30 (beginning of Stem Elongation) of the BBCH scale for cereal crops. The forecast is created for ten days. Data is updated on average every 24–30 hours.

We are busy evaluating the cereal disease risk models for South Africa.

## Crop Health. Yield Estimate

# Crop Yield Estimate

The Yield Estimate is an expected/predicted crop yield calculated by the system automatically. All estimates are generated for an individual field by comparing with fields from the target group and based on the following data:

## Crop

The system selects fields with the target crop type.

## Location

By default, the fields are selected in the radius of 200–500 km.

## Vegetation

The system selects the fields with similar Vegetation Indices.

## Variety

The system selects the fields with the same crop varieties, if any.

## Sowing Dates

The fields with the most similar seeding dates are selected.

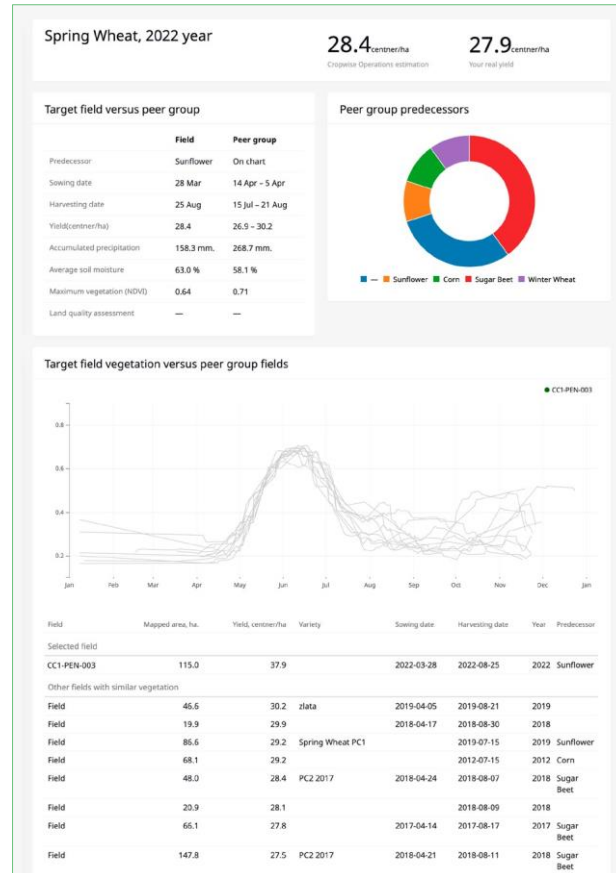

## Precipitation

The fields with the most similar precipitation data are selected.

The Yield Estimate feature is available for more than 15 crops. If images are available, the first forecast for winter crops can be generated on week 5–6 after snow melts, for spring crops — on the fourth week after emergence.

The system updates the estimate every time it gets a quality daily image and adjusts it when gets a high-resolution image. Cropwise Operations provides consolidated data on the Yield Estimate for each crop for field group, company, and individual estimate for each field.

The main contributing factor for the Yield Estimate accuracy is the quality and volume of the data entered by the users for analysis. In general, the more data (historical information) we have and the more detailed it is — the more accurate analysis we get from the system.

# Crop Yield Forecast. Tracking of Changes

The Yield Forecast tool allows the users to benchmark dynamics of the Yield Estimates for a field, field group, company, region, and country by crops in the web-based version of Cropwise Operations.

The tool shows the current Yield Forecast and the dynamics of its changes for two weeks. The forecast is available separately for crops, field groups and individual fields. The system compares crop yield forecast for the field group (the field) with the average indicator for the company, region, country.

In the Yield Forecast tab in the Agri section, a complete history of Yield Forecast changes is available both for a particular field group and an individual field. The user can easily track the indicators' history and see, for example, at what point the forecast began to decline, and identify the reasons for negative dynamics: weather conditions, technological errors, etc.

3 test farm	434	46.82	+3.79%
4 test farm	162	41.36	-4.38%
1 test farm	139	44.46	+1.94%

# Yield Matrix

The tool helps to identify productive and unproductive fields i.e., where yields are significantly higher or lower from season to season, as compared to the average factual and estimated yield of the field group.

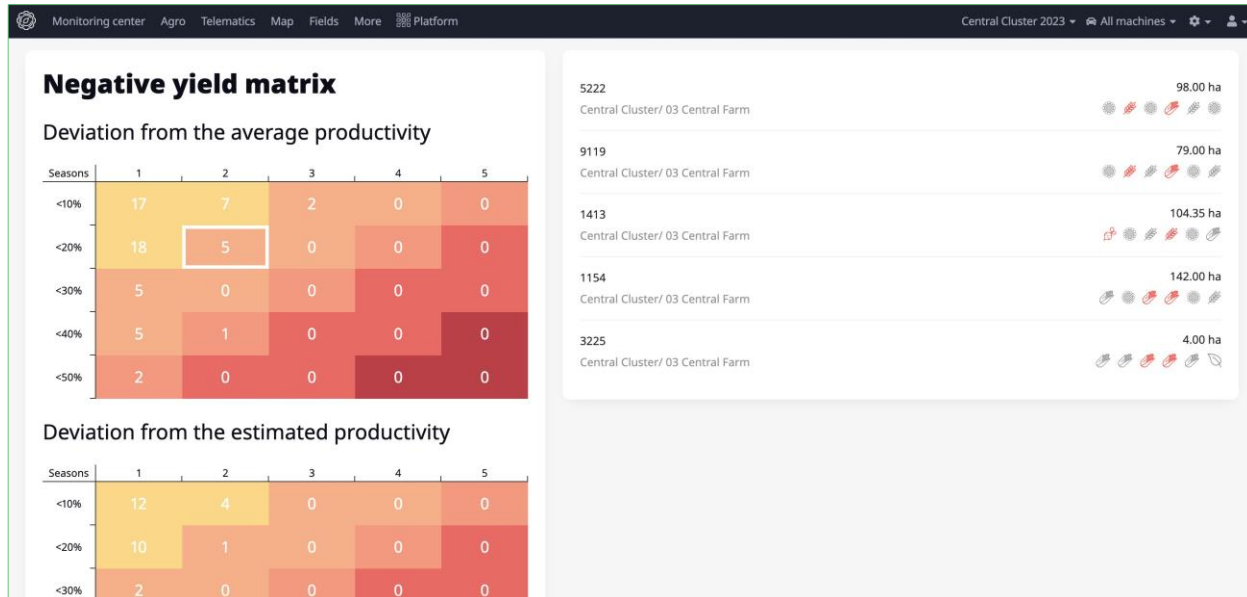

The system analyses actual and estimated productivity of the fields over five seasons and determines a deviation as a percentage of the group average. A field gets into the list of productive/unproductive fields when it demonstrates consistently high or low yields during several seasons in the row.

As a result, the user can immediately see the fields giving yields of 20% higher or lower in two out of five seasons as compared to the fields with the same crop in the same field group. Users are advised to pay attention to these fields.

For example, focus on the assets that bring significant risk and decide on future actions: work to eliminate risk factors, use such fields for more stable crops, get rid of the unproductive lands, or undertake more sustainable practices. The most productive fields can be used to grow high-profitable crops.

# Scouting Map

The tool helps to identify problematic areas in the fields more accurately, especially with Planet Labs' images available. With Scouting Map you can plan field inspections more efficiently and save up to \$0.5 per year per hectare on field trips by replacing random field inspections with targeted scouting of problematic areas.

Choose a field group and crop on the Scouting Map. Remotely analyze your crop's condition using Planet Labs' images and identify areas to check. To spot abnormalities in plant development in time, the system recommends comparing the NDVI Variability and NDVI Contrast images.

# Scouting Tasks

Cropwise Operations enables creating Scouting Tasks in manual and automatic modes. The tool allows to plan field inspections remotely and distribute scouting zones among agronomists.

Manual Tasks require actions from a responsible person. Based on the analysis of the satellite images, identify fields that require attention and select the user who will be assigned to scout a field. Automatic Tasks are created by the system according to the preset parameters. Such tasks can be linked to:

- Dates;
- NDVI changes;
- Crop Growth Stages;
- Agricultural Operations.

The Scouting tasks can be generated to check the fields prior to spraying. You can also set an inspection at a specific development stage. This feature is available for crops, growth stages for which are automatically recognized by the system, namely corn, sunflower, and winter wheat.

# Scouting in Mobile Apps

To increase the efficiency of crop data collecting during scouting we expanded the Scouting Reports toolkit in Cropwise Operations Mobile Apps. Scouting Tasks, an advanced form of the Scouting Report, Scouting Report Templates, the possibility to add Recommendations based on Scouting Reports are already available in the Apps for Android and iOS devices.

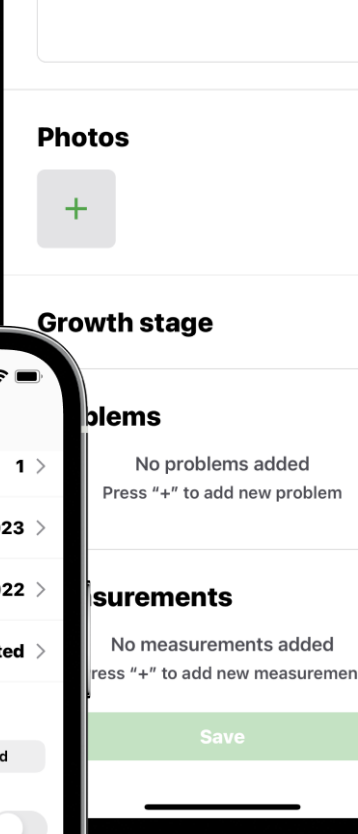

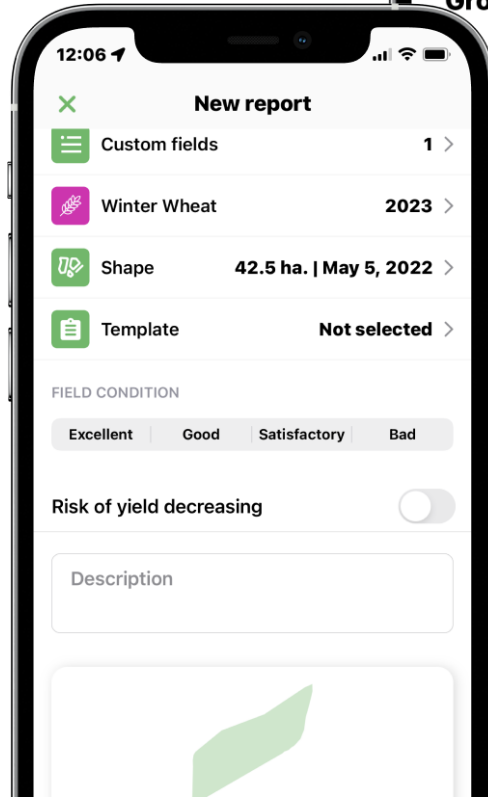

Inspect the fields according to the assigned tasks and add Scouting Reports with a description of each problem area to prevent problems in a timely manner.

The improved Scouting Report form in Cropwise Operations Mobile Apps helps the user to capture even more details of crop development. Consequently, there is an opportunity to identify and resolve the problems timely.

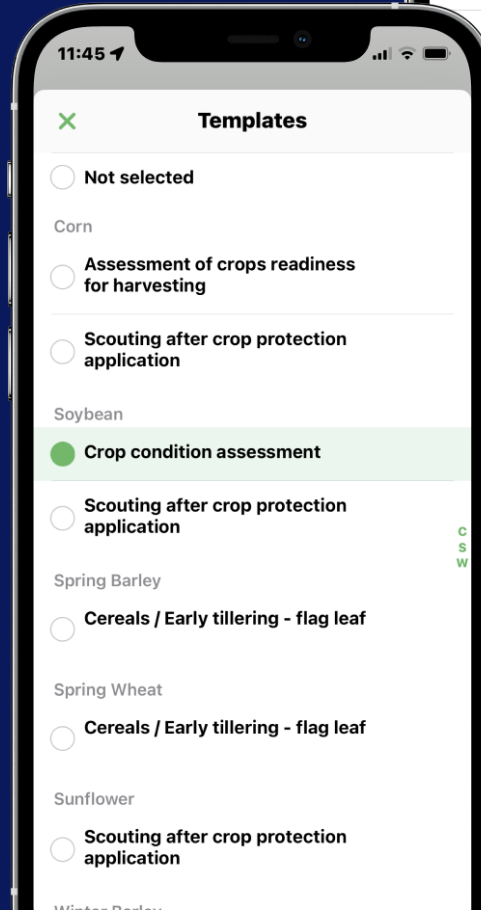

Select points on a field and document crop development details for the selected zones. You can add an unlimited number of photos for each point. Add detailed information about crops — from a growth stage to harvesting humidity. Assess the general condition of the field and the risks of declining yields. Make recommendations on work to be done to get a higher yield.

# Scouting Report Templates

One can create Scouting Report templates for different goals with a set of specific measurements. You can set different templates to use for scouting before and after specific agricultural operations, before harvesting, etc. The tool helps to speed up, standardize, and simplify the scouting process.

For example, to scout fields before harvesting, one can create a template with all required measurements for the crop – moisture content, ripeness percentage, etc. Selecting the template in the App the responsible person sees which measurements are required to be added. As a result, the collected data is very standard, that enables comparing it and making informed decisions.

# Scouting Reports Analytics

All Scouting Reports of your farm are gathered in one tab of the system. In a near real-time mode, track which fields are lagging in development, determine which factors have caused the problems and what can be done to prevent the losses.

Assign the Agronomist status to users and track their work results by area of responsibility: who created Scouting Reports and how many, how many fields and which ones were covered during certain time.

The screenshot displays the 'Monitoring center' interface with a navigation bar at the top containing 'Agro', 'Telematics', 'Map', 'Fields', 'More', and 'Platform'. The main content area is titled 'All' and includes filters for 'By users' and 'By catalogs'. A map shows several field locations with thumbnail images and report counts (e.g., 5, 2, 4, 7, 2). Below the map is a search bar for 'Scout reports by field name, growth stage' and a 'Columns' dropdown menu. A table lists the following data:

Scout report	Made at	Field	Count of reports by field	Number of days since last report	Crop   2022	Created by	Photos
#46113	June 22, 2021 11:16 AM	WC-BOT-008 62.76 ha	7	604	Winter Wheat	Regional Agronomist	
#46105	June 10, 2021 8:31 AM	MON-KOP-002 139.06 ha	3	616	Winter Wheat	Senior Agronomist	

# Pest Trap Monitoring

Keep record of your pest trap observations and trends across all your fields. We provide customisable reports on PowerBI to visualize observations and compile reports for auditing.

Trap ID	Pest name & Type	Blocks/fields

# Control Crop Conditions on Telegram

Cropwise Operations can notify its users about specific crop condition parameters recorded in Scouting Reports using a Telegram chatbot.

Connect a chatbot in the system and activate it in Telegram. A minute after a new Scouting Report appears in the system, you will receive a notification about it. The message will also contain information about risks of yield decreasing and plant threats levels if any. Such messages can be received by one person or several people in a Telegram channel.

# 6

## Agricultural Operations

# Agricultural Operations

In the system, one can plan, document, and control agricultural operations, taking into consideration field relief, soil type and composition, weather, crop growth stages, and current condition of the fields.

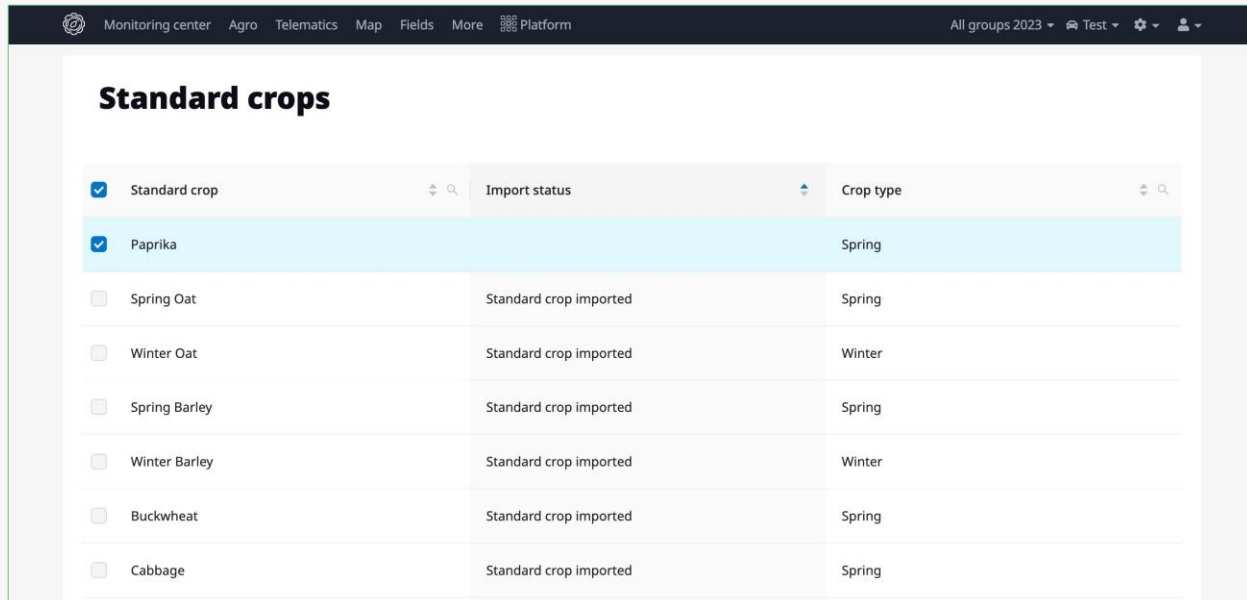

The advanced Agricultural Operations module will help you to make changes in the current agricultural works quicker and control different processes while performing sowing, fertilizers and CP products application, harvesting far more effectively.

# Standard Crops Catalog Improvements

The Cropwise Operations team has improved and simplified the work with the standard crops catalog. The list of standard crops in each new account has been reduced from 50 to 10 the most typical crops for a region, such as spring and winter wheat, barley, rapeseed, sunflower, corn, pea, potatoes.

The rest of the crops can be imported from the global database. The lists of typical crops by country will be also available in the system. The standard crops can now be deleted from the Cropwise Operations accounts.

<input checked="" type="checkbox"/> Standard crop	Import status	Crop type
<input checked="" type="checkbox"/> Paprika	Standard crop imported	Spring
<input type="checkbox"/> Spring Oat	Standard crop imported	Spring
<input type="checkbox"/> Winter Oat	Standard crop imported	Winter
<input type="checkbox"/> Spring Barley	Standard crop imported	Spring
<input type="checkbox"/> Winter Barley	Standard crop imported	Winter
<input type="checkbox"/> Buckwheat	Standard crop imported	Spring
<input type="checkbox"/> Cabbage	Standard crop imported	Spring

# Global CP Products Database Integration

This season Cropwise Operations enables its users to import CP products from the global database — the list of standard products officially registered in a specific country. The tool helps to unify the catalog and get the system recommendations on the CP products use that will help users to adhere to the CPP application technology and ensure effective crop protection.

The users can add a required item to the Catalog in the CP products tab. Additionally, there is an option to fast-add a CP product on the Agri Plans and Agri Operations creation pages.

## Directory of CP products

<input type="checkbox"/> CP products	Registration number	Type	Units of measurement
<input type="checkbox"/> <a href="#">Ridomil Gold Pepite</a>	L7191	Fungicide	Kilograms
<input type="checkbox"/> <a href="#">Ridomil Gold 480 EC</a>	L6851	Fungicide	Liters
<input type="checkbox"/> <a href="#">RIDOMIL GOLD FLO</a>	L6669	Fungicide	Liters
<input type="checkbox"/> <a href="#">RIDOMIL GOLD 480 SL</a>	L8962	Fungicide	Liters

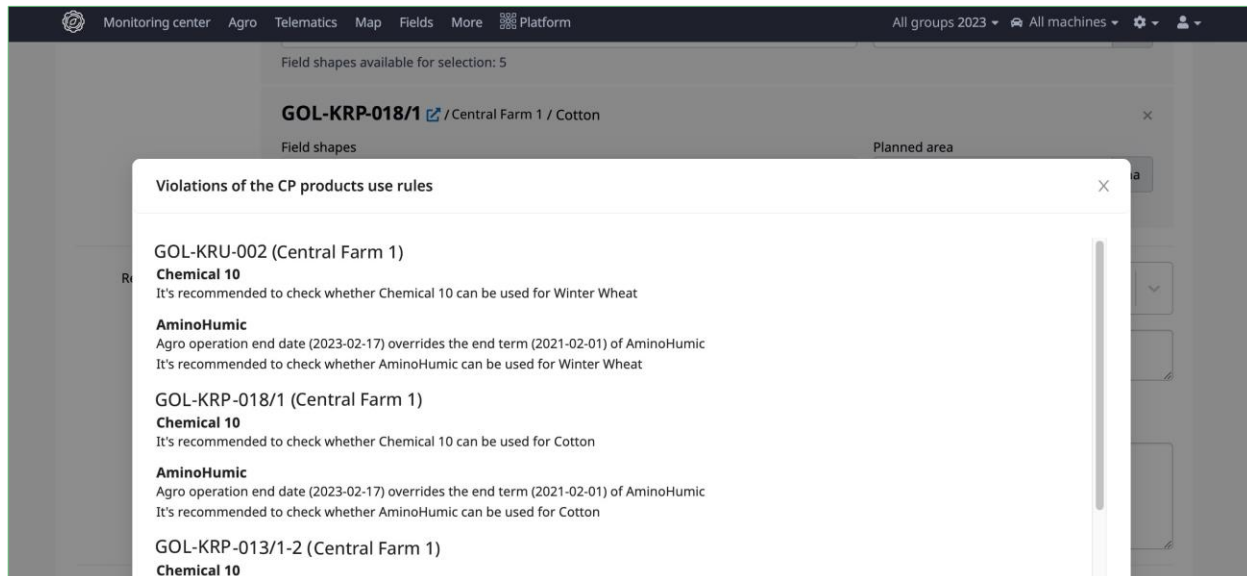

## Ridomil Gold 480 EC

Active substances list	<a href="#">METALAXYL-M</a>
Sale term	2018-12-31
Term of use	2018-12-31
Drug form	EC

# CP products Verification in Agri Operations

The unified list of CP products imported from the global database is a complete must-have for getting the system recommendations on the pesticide application practices.

After saving a CP product application operation the systems checks if the requirements for using a certain CP product are not violated. At the moment the validations by crops and a CP product expiration date are available. In total there will be around eleven validation parameters. Unless the CP product meets certain requirements, the system will display a warning. The user can follow it and make changes to the operation or ignore the warning.

# VRA Builder

Even a good field can vary by productivity zones. The VRA builder tool enables adjusting the rates of seeds, fertilizers, and CP products depending on the soil type and composition, the needs of each field zone, and the planned yield. It helps to optimize costs and get higher economic effect from each area of the field.

The system differentiates productivity zones in fields based on the analysis of historical satellite images, vegetation, UAV images, productivity, and soil texture maps as well as the distribution of macro- and micronutrients in the soil according to the soil tests.

Afterwards Cropwise Operations generates recommendations on the optimal application rates for each zone. At the same time the user can manually determine the application rates of seeds, fertilizers, CP products for each zone disregarding the system recommendations.

Cropwise Operations users can download the VRA task map to a removable data storage device in multiple formats (ISOBUS, ESRI Shapefile) and connect it to the on-board computer of their machinery (Amazone, Amatron, CaseIH, John Deere, Trimble) or export it to their MyJohnDeere account directly.

# Automatic Alerts

The Automatic Alerts tool helps Cropwise Operations users to track abnormalities in crop development and prevent spreading of various problems. One can set up the following alerts: the Vegetation Index (NDVI) and Yield Estimation change, the NDVI exceeding or dropping below a certain threshold, the potential risk of disease spreading. There are also notifications about fields where crops have not been harvested, and alerts about crop threats.

The system will generate alerts after checking all the required conditions previously set by the user in the alert settings. The responsible users will receive notifications about the event via email, SMS, or Telegram messages. To receive the messages via Telegram the user should activate the connection to the chatbot. Telegram notifications are clearer and much more informative.

The screenshot displays the Cropwise Operations web interface. At the top, a navigation bar includes 'Monitoring center', 'Agro', 'Telematics', 'Map', 'Fields', 'More', and 'Platform'. On the right, it shows 'All groups 2022', 'All machines', and user settings. The main content area features a sidebar on the left with a 'Coslog' icon and a list of links: 'Dashboard', 'Soil', 'Agrooperations status', 'Agro operations', 'Scouting tasks', and 'Scout reports'. The central focus is an 'Alert' card with a red 'Active' status. The alert details are as follows:

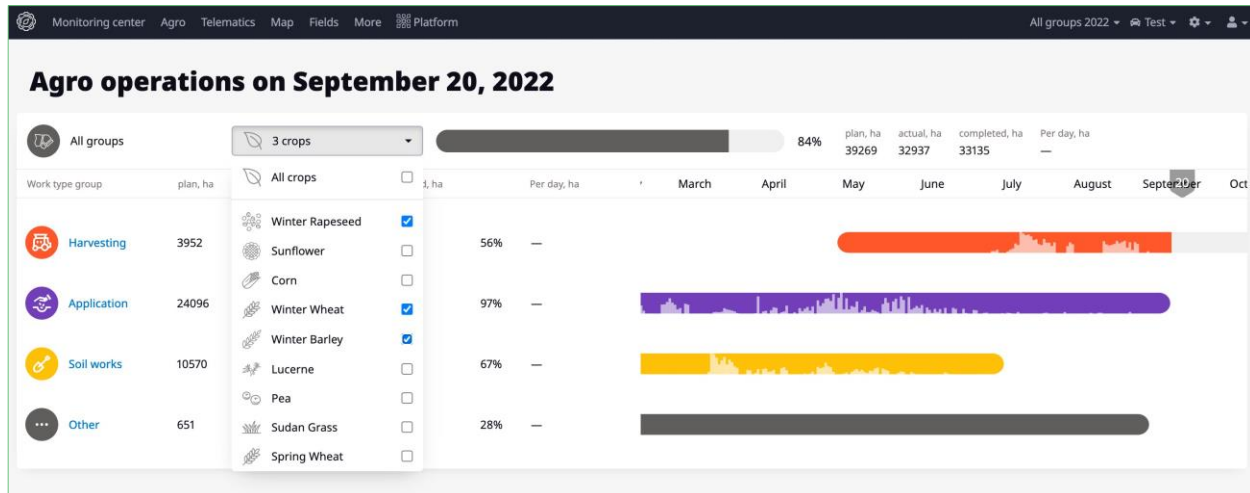

Alert type	Fields
Automatic alert	<a href="#">#46 NDVI Change</a>
Opened at	16.06.2022 12:45:24
Closed at	
Event start	16.06.2022 12:45:24
Event stop	20.06.2022 12:45:24
Duration	4 days
Created by	

To the right of the alert card is an 'Alert history' section showing a single entry: '16 Jun 12:45' with a green plus icon and the text 'Cropwise Operations system'.

# Work Report

The Report displays the latest data on processed and completed areas for all the agricultural operations that are carried out in a field group. The system is constantly updating the data throughout the day.

The data is grouped by crops. The information by work groups (application, harvesting) is displayed by default for the selected field group. The data by work types (spraying, sowing, etc.) is displayed separately for the field group and fields. On the charts one can track the dynamics of the current seasonal works and compare the results with the previous seasons.

# Application Report

The Report on seeds, fertilizers, and CP products application is formed using the operations results of the Application work type group. For the system to create the Report you should specify the planned and completed application rates of seeds, fertilizers and CP products in agricultural operations.

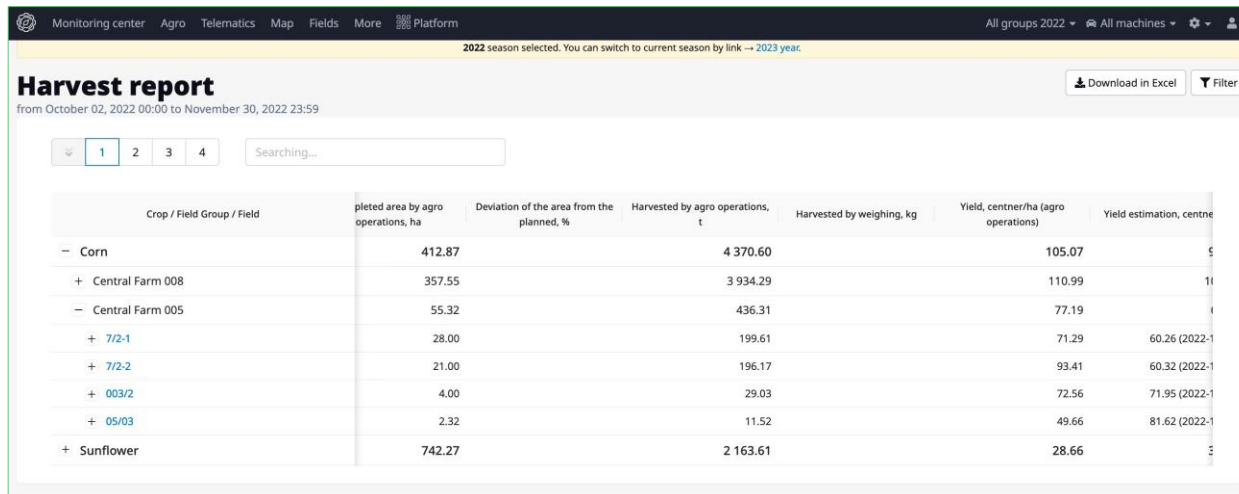

The Report displays data on the completed work area, planned and completed application rates as well as the deviation percentage between the total number of elements planned for application, and the actual application for a specific crop as of a selected time frame.

	Completed area, ha.	Elatus Era, I.			
		Plan	Fact	Deviation, %	Norm
- Winter Wheat	0.00	170.50		-100.00	
- Field-003B	0.00	39.89		-100.00	
#95443 Application / Spraying	0.00	39.89		-100.00	
+ Field-008A	0.00	43.93		-100.00	
+ Field-001/2A	0.00	86.68		-100.00	
<b>Total</b>	<b>0.00</b>	<b>170.50</b>		<b>-100.00</b>	

# Harvest Report

The Report provides data on harvested areas, crops and crop yields by field groups. The data is grouped by crops. The data could be entered manually or integrated from the Harvesting operations and machine weighings.

The user can configure the harvest data integration from agricultural operations into the Report by setting the appropriate data source mode in the company's account settings.

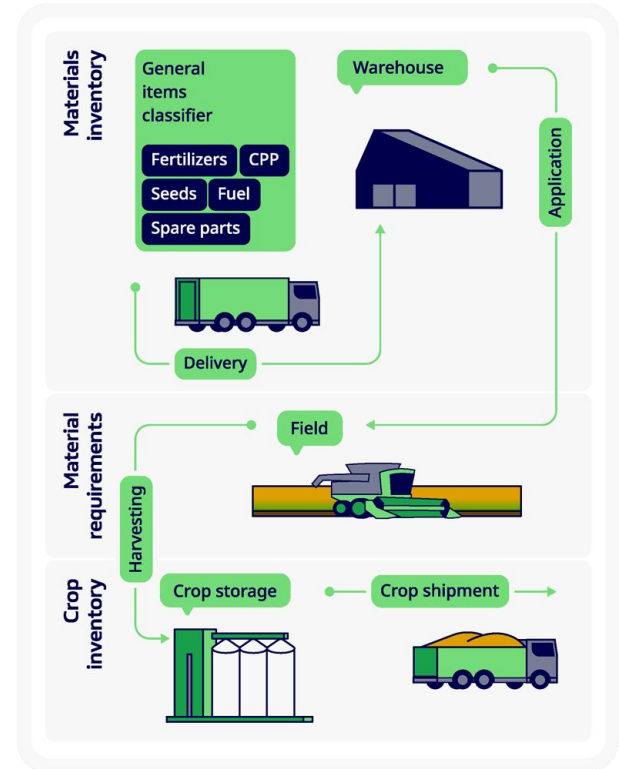

Crop / Field Group / Field	Harvested area by agro operations, ha	Deviation of the area from the planned, %	Harvested by agro operations, t	Harvested by weighing, kg	Yield, centner/ha (agro operations)	Yield estimation, centner/ha
- Corn	412.87		4 370.60		105.07	
+ Central Farm 008	357.55		3 934.29		110.99	
- Central Farm 005	55.32		436.31		77.19	
+ 7/2-1	28.00		199.61		71.29	60.26 (2022-1)

+ 003/2	4.00		29.03		72.56	71.95 (2022-1)
+ 05/03	2.32		11.52		49.66	81.62 (2022-1)
+ Sunflower	742.27		2 163.61		28.66	

# Warehouse and Stock Management (WMS)

The feature enables growers to streamline their farm's inventory items, monitor and regulate inventory movement, and conveniently control stock levels from a centralized location.

- create a single directory of inventory items on the farm (CP products, fertilizers, seeds, spare parts, fuel, crops, etc.),
- record purchase, relocation, and write-off operations,
- plan seasonal inventory items requirement,
- monitor actual inventory stock,
- track all the materials issued to agronomists, drivers, and other personnel

The Farm Warehouse and Inventory Management tool was implemented first for growers in Poland and Ukraine. However, it is now available to all Cropwise Operations users upon request.

# Available Features

## Advanced Measurement Units Catalog

In the system both default units (for measurement of weight, volume, length, etc.), and custom units (box, bag, pack, etc.) will be available. Also, the conversion rules of one measurement unit into another will be developed.

## Warehouses

The lists of storing places corresponding to the company's warehouse structure will be created in the system. They will also be used in the documents demonstrating the Inventory movements.

## Register of Inventory Names

The system will allow the users to register different types of Inventory and goods, such as seeds, fertilizers, CPP, spare parts, agricultural equipment, and so on.

## New Documents

Three new documents will be available to demonstrate Inventory movement:

- Incoming
- Outgoing
- Internal movement

# 7

## Telematics and Integrations

# Telematics

**The Telematics module allows operational monitoring and effective control of the machinery and fields in one system.**

## **The users can monitor fields work progress in real time:**

Processed areas, how much is left to cover, what is the current state of fields.

## **Complete information about each machinery unit:**

General data, assigned tasks, and various alerts on unauthorized tasks, speed limit violations, fuel consumption, etc.

## **Full control of machinery is available:**

Location, speed, daily work plan, covered area, movement and stops duration, fuel consumption, violations, drivers, etc.

## **Comparison of the work quality with a crop condition:**

Respond to problem areas in a timely manner and adjust the technological process for higher efficiency.

# New Features

**Monitoring Center for Drivers**

**Improved form of GPS sensors configuration**

**Report on sensor recalculations launched by the user**

**Comparative table of raw and counted data for sensors**

**As–Applied and Yield maps based on data from machine GPS tracker sensors**

**Detailed statistics on drivers' work on the task page**

**The Webdispecink monitoring system and all available versions of the iAZS API integration**

**Machinery Data Integration Improvements**

**Bulk downloading of VRA task–maps for several fields**

**The Telematics App Improvements:**

- **Building a route to a field from a machine's task,**
- **Drivers' access to the App,**
- **Push notifications on assigned task to drivers.**

# GPS Tracker Sensors Data

The Cropwise Operations team keeps constantly working on improving data quality that the system receives from different sensors connected to GPS trackers and on its displaying and analysis in the system.

We have improved a form of GPS sensors configuration and the sensor history values page. The tools became more consistent, faster, and more user-friendly.

Additionally, the team has launched the data filtering feature that enables users to exclude false and incorrect values from all types of sensors supported by the system without using any complex calculations. The report on sensor recalculations launched by the user is now available as well.

This season as-applied and yield maps based on data from machine GPS tracker sensors are also available.

# Drivers' Monitoring Center

The Cropwise Operations team has extended the drivers' access rights in the system.

This season such users will have their own Monitoring Center on the web-based version of Cropwise Operations: one page with assigned tasks and statistics for the past selected period will be available. Additionally, the drivers will have access to the Telematics App and will receive push notifications on assigned tasks.

The screenshot displays the 'Monitoring center' interface. It features a main map area with a red task boundary and a green location marker. Below the map is a task summary for 'Task #179409' (Soil works / Discing) with various performance metrics. To the right, there are sections for 'Statistics by tasks' and 'Assigned tasks'.

**Monitoring center**

#179394			

# Machine Task Page

This season the Cropwise Operations users will get more useful information on the machine task page. At the moment the following new features are available: the machine movement chart and additional data on fuel, such as fuel level at the beginning and at the end of the task, information on refueling during the task.

Additionally, one can get the detailed statistics on drivers' work, such as completed area for each field. Information on the driver's working time is sourced from the driver's personal identifier sensors.

**Task #166130**

**Plan**

# Alerts

The Alerts tool helps to track all violations in work of machinery and drivers, fix various kinds of problems with machines, implements, GPS tracker sensors. Two types of alerts are available in the system — automatic and manually created.

Automatic alerts are generated based on the parameters preset by the users. The signals are transmitted by the sensors installed on machinery and when a machine or equipment reaches the parameters, such as maximum speed, minimum distance, etc., the notification is sent to the user. Such alerts are triggered in the system automatically without any additional actions.

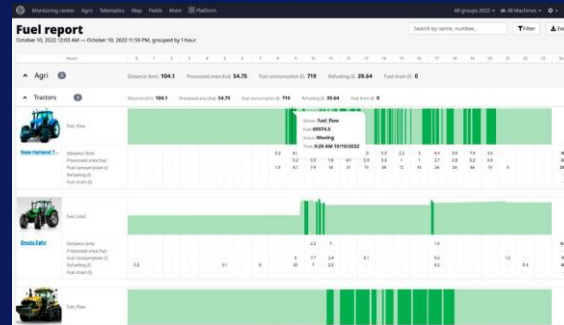

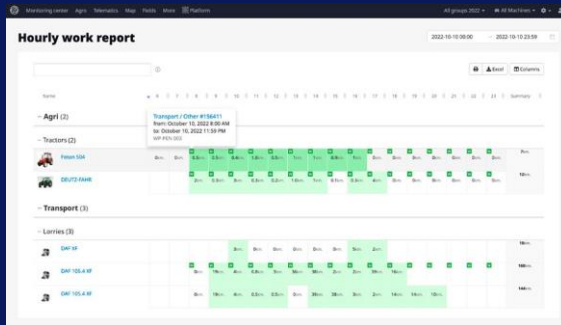

Manual alerts cannot be generated based on the signals from any equipment. Such alerts require monitoring and actions from the responsible persons. For example, mistakes in agricultural operations planning or unusual situations e.g., driver suddenly got sick during work and so on.

# Reports

Would you like to control your machinery much more efficiently and receive accurate data on harvesting and sowing to respond to all problems in time? Use the machinery performance reports of the Telematics module generated based on data from GPS trackers.

Reports will help you to analyze the machinery workload, obtain data on the machine work results per hour and day, machinery maintenance, active alerts, monitor fuel consumption by each vehicle remotely, identify machines and implements that are used inefficiently, and plan work more rationally.

# Machinery Integration

We are constantly working on improving the Cropwise Operations integration with third-party systems, products, and services to collect all the data the users need in one place and in a convenient form.

At the moment the users can synchronize data on fields, agricultural operations, telematics, yield, and as-applied maps with services from CLAAS, CNH Industrial, John Deere, Raven Industries, SkyFMS, and iAZS.

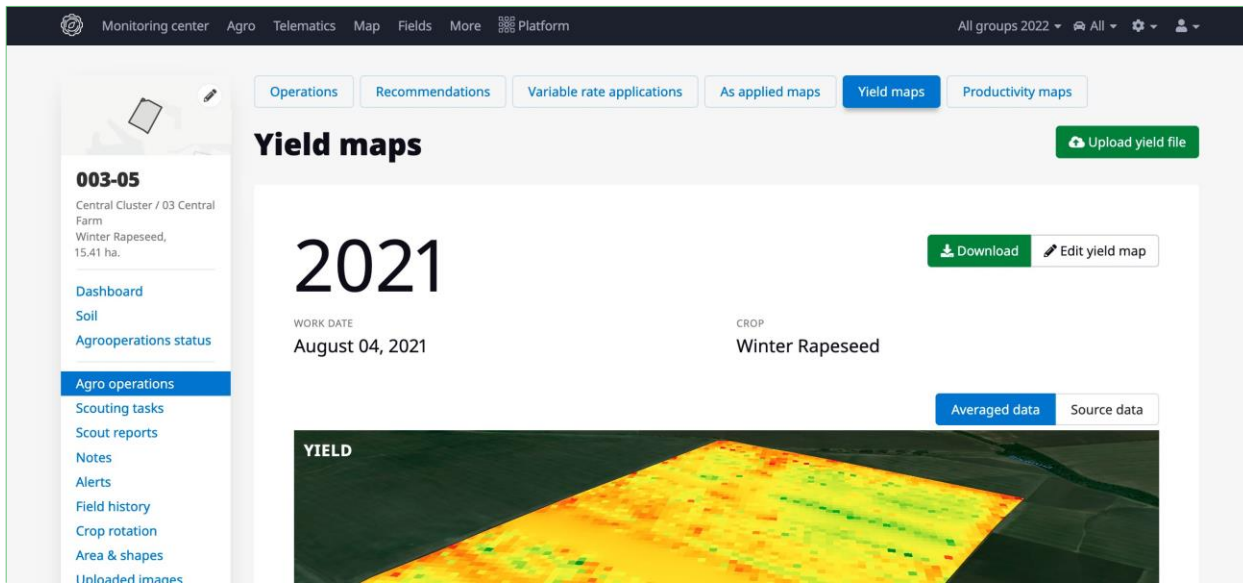

The screenshot shows the 'Machinery' section of the Cropwise Operations interface. The top navigation bar includes 'Monitoring center', 'Agro', 'Telematics', 'Map', 'Fields', 'More', and 'Platform'. The main content area is titled 'Machinery' and features a sidebar with navigation options: 'My farm', 'Modules', 'Agricultural expertise', 'Mobile apps', 'Farmer to farmer', 'Weather stations', 'GPS, RTK', 'Machinery' (highlighted), and 'Integrations'. The main content area displays three integration cards: 'CLAAS' (Connect Cropwise Operations with data from CLAAS TELEMATICS fleet management system), 'CNH' (Connect Cropwise Operations with AFS Connect™), and 'MyJohnDeere' (Online platform for management of JohnDeere machinery work). Each card includes the respective company logo.

# As-Applied and Yield Maps

Upload As-Applied and Yield maps into Cropwise Operations from your machinery to visually assess the distribution of seeds, fertilizers, and CP Products in fields, obtain yield data from each hectare, and identify productive and problematic areas.

The user can add maps from the Agleader, Case IH, CLAAS, Hexagon, Farm TRX, John Deere, New Holland, Raven, and other machinery. By the start of a new season the team has improved the tool with the abilities to save multiple as-applied and yield maps at once in one click, filter maps by raw data, attach files to the maps, get total data on the maps imported from John Deere and Raven.

The screenshot shows the Cropwise Operations web interface. At the top, there is a navigation bar with 'Monitoring center', 'Agro', 'Telematics', 'Map', 'Fields', 'More', and 'Platform'. On the right of the navigation bar, it says 'All groups 2022' and includes icons for a search, settings, and user profile. Below the navigation bar, there are several tabs: 'Operations', 'Recommendations', 'Variable rate applications', 'As applied maps', 'Yield maps' (which is active), and 'Productivity maps'. A green button labeled 'Upload yield file' is located to the right of the 'Yield maps' tab.

The main content area is titled 'Yield maps'. It displays the year '2021' in large text. Below this, it shows 'WORK DATE August 04, 2021' and 'CROP Winter Rapeseed'. There are buttons for 'Download' and 'Edit yield map'. At the bottom of the main content area, there is a heatmap visualization of a field, labeled 'YIELD'. Below the heatmap, there are buttons for 'Averaged data' and 'Source data'. On the left side of the interface, there is a sidebar menu with the following items: 'Dashboard', 'Soil', 'Agrooperations status', 'Agro operations' (which is highlighted in blue), 'Scouting tasks', 'Scout reports', 'Notes', 'Alerts', 'Field history', 'Crop rotation', 'Area & shapes', and 'Unloaded images'.

## Pricing

# Pricing

The following fees apply until 28 February 2024.

<b>Crop group</b>	<b>Standard tariff</b>
<b>Winter small grain (cereals)</b> (wheat, barley, oats, canola, lupins, medics, lucerne, grazing, etc.)  <b>Summer row crops</b> (maize, soyabean, sunflower, etc.)  <b>Other field crops</b> (cotton, sugarcane, tobacco, etc.)	<b>R18/ha/year</b>
<b>Potatoes</b> <b>Vegetables</b>	<b>R50/ha/year</b>
<b>Orchards, vineyards and tree nuts</b>	<b>R50/ha/year</b>
<b>Planet Labs daily satellite imagery (3x3m)</b>	<b>R18/ha/year</b>

- 60-day free trial period applies
- A Minimum annual subscription fee of R4900/client/year applies
- All fees are exclusive of VAT
- Special fees and incentives are available for Syngenta crop protection clients (available on request)
